

# Personality Type

## ▼ Attachment Style

I am an Anxiously-Avoidant Attached person characterized by:

### Avoidant Traits

- I worry and focus a lot on my independence and worry about it being threatened
- I struggle to share my innermost feelings and thoughts with my partner
- I find it difficult to rely on romantic partners
- It makes me uncomfortable when my partner gets too close
- My partners often want me to be more intimate than I am ready being
- I don't like feeling like people depend on me
- Sometimes when I get what I want in a relationship, I'm not sure if I want it anymore

### Anxious Traits

- I worry my partner will stop loving me
- I fear that once someone gets to know the real me, they won't like who I am
- When I show my partner how I feel, I worry they won't feel the same about me
- I tend to get very quickly attached in a romantic relationship
- I am very sensitive about my partners moods
- I worry that if my partner leaves, I won't ever find anyone else
- I worry that I am not attractive enough

- If someone I'm dating acts cold, I worry I've done something wrong

## ▼ Love Language

[Love Languages Test](#)

### Test Description

Different people with different personalities give and receive love in different ways. By learning to recognize these preferences in yourself and in your loved ones, you can learn to identify the root of your conflicts, connect more profoundly, and truly begin to grow closer.

### Results

### Quality Time™

In Quality Time™, nothing says “I love you” like full, undivided attention. Being there for this type of person is critical, but really being there—with the TV off, fork and knife down, and all chores and tasks on standby—makes you feel truly special and loved. Distractions, postponed

activities, or the failure to listen can be especially hurtful. Whether it is spending uninterrupted time talking with someone else or doing activities together, you deepen your connection with others through sharing time.

### Physical Touch™

A person whose primary language is Physical Touch™ is, not surprisingly, very touchy. Hugs, pats on the back, and thoughtful touches on the arm—they can all be ways to show excitement, concern, care, and love. Physical

presence and accessibility are crucial, while neglect or abuse can be unforgivable and destructive. Appropriate and timely touches communicate warmth, safety, and love to you.

### Words of Affirmation™

Actions don't always speak louder than words. If this is your love language, unsolicited compliments mean the world to you. Hearing the words, “I love you,” is important — hearing the reasons behind that love sends your spirits

skyward. Insults can leave you shattered and are not easily forgotten. You thrive on hearing kind and encouraging words that build you up.

### Acts of Service™

Can helping someone out really be an expression of love? Absolutely! Anything you do to ease the burden of responsibilities weighing on an “Acts of Service” person will speak volumes. The words he or she most wants to hear: “Let me do that for you.” Laziness, broken

commitments, and making more work for them tell speakers of this language their feelings don't matter. When others serve you out of love (and not obligation), you feel genuinely valued and loved.

### Receiving Gifts™

Don't mistake this love language for materialism; the receiver of gifts thrives on the love, thoughtfulness, and effort behind the gift. If you speak this language, the perfect gift or gesture shows that you are known, you are cared for, and you are prized above whatever was

sacrificed to bring the gift to you. A missed birthday or a hasty, thoughtless gift would be disastrous—so would the absence of everyday gestures. Gifts are heartfelt symbols to you of someone else's love and affection for you.

## ▼ Myers Briggs / 16 Personalities

Myers Briggs Test

### Test Description

The Myers-Briggs® system consists of four preference pairs that reflect different aspects of personality—opposite ways to direct and receive energy through Extraversion (E) or Introversion (I), take in information with Sensing (S) or Intuition (N), come to conclusions using Thinking (T) or Feeling (F), and approach the outside world through Judging (J) or Perceiving (P). Most people find that one preference, in a preference pair, best describes their natural way of doing things, where they feel the most comfortable being themselves, outside of any roles they play in life. When the letters for each of these preferences are combined, 16 distinct personality types form which consist of different characteristics unique to that type.

### Results

INFP-T

Your personality type is:

## Mediator

INFP-T

Mediators are poetic, kind, and altruistic people, always eager to help a good cause.

### Energy

## 62% Introverted

## ▼ ChatGPT Supported Psychological Profile

### Comprehensive Psychological Profile: Michael Slusher (Updated)

**Michael Slusher** is a deeply creative, sensitive individual navigating life as a neurodivergent (ADHD) person with a complex emotional landscape shaped by past traumas. He has developed a growing self-awareness of how his ADHD, attachment style, core beliefs, and life experiences intertwine. This updated profile integrates new reflections on his ADHD management struggles, emotional sensitivity, attachment fears, identity beliefs, perfectionism, creative flow states, coping tools, unresolved trauma, and passion for self-improvement. Throughout, Michael is learning to reconcile these facets of himself with compassion and understanding, highlighting an evolving sense of identity and hard-won resilience.

### Neurodivergent Mind: ADHD and Executive Functioning Challenges

Michael's **ADHD** (diagnosed in childhood) profoundly influences his daily life, presenting both strengths and challenges. He experiences classic ADHD-related executive function difficulties in organizing tasks, managing time, and

sustaining routines. In fact, **maintaining systems and habits** (like keeping up with a Notion planner or calendar) is an ongoing struggle – a **Catch-22 of ADHD** is that while daily habits would help, ADHD symptoms make it “inordinately difficult to establish and consistently follow routines”[additudemag.com](https://www.additudemag.com). His brain craves novelty and bristles at monotony, so even well-intentioned schedules often fizzle out as **boredom and impulsivity** take over[additudemag.com](https://www.additudemag.com). Common ADHD pitfalls like perfectionism and all-or-nothing thinking can derail his great intentions with routines[additudemag.com](https://www.additudemag.com) – for example, if he can’t follow a system perfectly, he may abandon it entirely in frustration. This can lead to a cycle of starting organizational schemes with enthusiasm, then gradually dropping them when they become dull or overwhelming.

One prominent ADHD challenge for Michael is **task initiation and switching**. He frequently feels “stuck” when trying to begin tasks – a phenomenon often called *task paralysis*[healthline.com](https://www.healthline.com). Outsiders might mistake this for laziness, but in reality “goal-directed behavior is frozen” despite his genuine desire to get started[healthline.com](https://www.healthline.com). This paralysis often stems from a mix of **anxiety**, mental overwhelm, and executive dysfunction[healthline.com](https://www.healthline.com). Michael might stare at a to-do list, unable to pick an entry point, especially if tasks lack immediate interest or have many steps. Similarly, switching from one activity to another can be **jarring** – he tends to **hyperfocus** on things that deeply engage him (a well-known ADHD trait[healthline.com](https://www.healthline.com)), losing track of time, but then struggles to pull away and transition to the next obligation. Research notes that people with ADHD-Inattentive type, like Michael, have poorer task-switching ability partly because inattention makes it harder to plan ahead for the next task[healthline.com](https://www.healthline.com). Michael experiences this firsthand: without a clear plan or external cue, he may linger in his current “zone” or procrastinate the next task, reacting to immediate distractions (like an enticing YouTube video) instead of moving on promptly. While hyperfocus on a creative project can be a **strength**, it becomes maladaptive when, say, a night of editing video content causes him to miss other pressing duties or sleep.

**Impulsive distractions** are another aspect of his ADHD profile. Michael often finds himself **gravitating to instant-reward activities** (e.g. scrolling YouTube or social media) in the middle of tasks that require sustained effort. This isn’t mere irresponsibility – ADHD brains have an “interest-based nervous system,”

meaning they're motivated by engaging, novel, or emotionally rewarding tasks, not by abstract importance [laconciiergepsychologist.com](http://laconciiergepsychologist.com). In Michael's case, a boring or tedious task (even if objectively important, like paying bills or writing an email) can't hold his attention, whereas a fascinating video or a new creative idea immediately seizes his focus. **Interest and emotion propel his attention**, whereas external demands or distant deadlines feel too theoretical to activate his brain [laconciiergepsychologist.com](http://laconciiergepsychologist.com). Understanding this, Michael recognizes that he works best when he finds personal meaning or curiosity in a task. He is trying to “hack” his productivity by injecting interest into chores (for example, gamifying routine tasks or listening to music to make paperwork more tolerable). Still, staying on track day-to-day is an uphill battle. He often laments how he sets up elaborate productivity systems or reminders, only to **forget to use them consistently**, or how he intends to take a 5-minute break that turns into an hour down an internet rabbit hole before he even realizes it.

Despite these challenges, Michael's ADHD also **contributes to his creativity and enthusiasm**. When a project aligns with his passions – such as a film editing project or a spontaneous brainstorming session – he can tap into tremendous energy and focus. Colleagues might see him as “in the zone” where he accomplishes an impressive amount in little time, a state he cherishes. The flip side is that mundane but necessary tasks (paperwork, organizing files, etc.) feel disproportionately draining. He is actively working on strategies to bridge this gap, like **body-doubling** (having another person present to keep him accountable during tasks) and breaking work into smaller chunks to ease initiation. Michael's growing self-awareness of his neurodivergent mind is helping him practice more **self-compassion**; he now understands that difficulties with routines or motivation are not personal failures but part of how his brain is wired. By reframing these challenges as manageable with the right supports (rather than as moral flaws), he is slowly learning to balance accepting his ADHD-related limits with leveraging its unique strengths.

## Emotional Sensitivity and Regulation Difficulties

Emotionally, Michael is **highly sensitive and deep-feeling**, which is both a core strength and a source of hardship. He possesses an acute empathy and **rich emotional depth** – he laughs, loves, and grieves with intensity – but he also

experiences negative feelings in an amplified way. When stress or conflict arises, Michael's emotional reaction can be **overwhelmingly strong and enduring**. In tense moments (such as an argument or a perceived criticism), he often feels a sudden wave of hurt or panic, far beyond what an outside observer might expect. This extreme emotional sensitivity aligns with what ADHD literature calls **Rejection Sensitive Dysphoria (RSD)** – an experience of intense pain at any hint of rejection or criticism [additudemag.com](http://additudemag.com). For Michael, even small slights can trigger an outsized surge of **self-criticism and despair**. For instance, a mildly harsh tone from a friend might send him spiraling into thoughts like *"I'm a terrible friend; I always mess things up; no one will ever truly like me."* These thoughts reflect long-held wounds around **worthlessness** and fear of not being good enough. In the moment, the emotional pain truly feels *"unbearable"* and **all-consuming**, as Dr. William Dodson describes for people with RSD [additudemag.com](http://additudemag.com). It's not that Michael is weak or "over-reacting"; rather, his nervous system registers these interpersonal upsets as genuine threats, flooding him with distress that **hurts more than it would for someone without his background** [additudemag.com](http://additudemag.com).

One hallmark of Michael's emotional profile is a **delayed return to baseline**. After a triggering incident, he cannot simply "shake it off" in a few minutes. His body and mind tend to remain in a state of **hyperarousal**, the fight-or-flight mode stuck in the "on" position, long after the actual event [my.clevelandclinic.org](http://my.clevelandclinic.org). In these periods, he might feel a racing heart, shaky hands, or just a pit in his stomach that won't go away. Mentally, he often becomes trapped in **ruminative loops** – replaying what happened, imagining worst-case outcomes, questioning his self-worth. For example, if a conflict with a loved one occurs in the morning, he might spend the entire rest of the day in a fog of anxiety and sadness, unable to fully focus on anything else. He has described this as *"going down an existential rabbit hole"*: a small dispute can lead him to question his value in others' lives, the purpose of his efforts, or even the point of life itself. This kind of **existential spiral** likely has roots in both his neurodivergence and trauma history. Psychologically, individuals with unresolved childhood trauma often have an overactive stress response and difficulties soothing themselves after being upset [my.clevelandclinic.org](http://my.clevelandclinic.org). Michael indeed finds that once his emotions are triggered into a high state, it takes significant time (and often external comfort) for his nervous system to

calm down. During that window, logic has little effect – no matter how much he tells himself that he's overreacting or that things will be fine, the feelings of shame or fear persist intensely.

Michael's **inner critic** is particularly loud during these episodes. He is prone to harsh self-blame, sometimes berating himself with thoughts like "I'm a burden," "I ruin everything," or "I'm fundamentally broken." These cognitions show how negative core beliefs kick in when he's dysregulated. It's as if the emotional storm dredges up every insecurity from the depths. While in a calm state Michael can acknowledge intellectually that those statements aren't objectively true, in the heat of the moment he *feels* them as absolute truth. Such internalized negative beliefs (e.g. *"I am fundamentally unlikable"* or *"I'm bound to disappoint those I care about"*) were formed early from painful experiences and tend to resurface under stress. They function as **rigid core beliefs** that aren't easily shaken by rational evidence [medicalnewstoday.com](http://medicalnewstoday.com) – for example, even though Michael has many friends who appreciate him, when he's emotionally triggered he "forgets" that and zeroes in on the fear that once people see the "real him," they won't like him. (Tellingly, he has literally voiced that fear in the context of relationships: *"I worry that once someone gets to know the real me, they won't like who I am,"* which is a classic anxious attachment belief.)

Another aspect of Michael's emotional sensitivity is how it can manifest externally. Sometimes his hurt converts to **anger or frustration** (especially if he feels misunderstood or cornered), though more often it turns inward as depression or anxiety. On occasion, if the emotional intensity is too high, he might experience a kind of emotional *shutdown* or numbness – a protective response where his mind "detaches" because the feelings are too overwhelming. This can seem like withdrawal or stonewalling to others (discussed more in the attachment section), but it's often the only way he knows to cope in that moment. He is not someone who can easily plaster on a smile when upset; his emotions run hot and honest. The upside is that this **depth of feeling gives him great capacity for empathy and creativity** – he can channel profound emotions into art, and he is often the friend who truly *gets it* when someone else is hurting. The downside is the personal toll: frequent emotional turbulence and slow recovery from upsets leave him

exhausted and, at times, anxious about when the next emotional “hit” will come.

**Regulating back to baseline** is a skill Michael is actively working to improve as part of his self-growth. He has started to recognize early signs of being triggered (for example, noticing when his thoughts are racing or all-or-nothing) and is learning techniques to self-soothe. This includes taking a step away to breathe, using music to modulate his mood, or reaching out to a trusted support (like his father or a close friend) for grounding reassurance. Journaling also helps him process the intensity (more on this in coping section). It's a gradual process, but he has made some progress. Where in the past a conflict might dysregulate him for days, now he might manage to calm himself by the next morning by consciously engaging coping tools. He has also educated those close to him about his RSD-like reactions, explaining that when he seems to overreact or withdraw, it's because he feels pain “10/10” even if the situation is “2/10.” By contextualizing his sensitivity in this trauma-informed way, he is fostering more understanding relationships and finding it slightly easier to ask for what he needs (like patience, reassurance, or space) in those tough moments. In summary, Michael's emotional world is intense and at times volatile, but it stems from a place of **deep care** – he cares so much about others and doing right that any disconnection or misstep hurts profoundly. With growing self-awareness, he is slowly learning to ride these emotional waves with more skill, treating himself with the same empathy he readily gives to others.

## Attachment Style and Interpersonal Patterns

In relationships, Michael exhibits traits of an **insecure attachment style** that blends both anxious and avoidant tendencies – often referred to as a *fearful-avoidant* or *anxiously-avoidant* attachment. This means he deeply **craves closeness and emotional safety**, yet simultaneously **fears being hurt, rejected, or overwhelmed** by intimacy. It's an internal push-pull that significantly impacts how he interacts with loved ones.

On the **anxious side**, Michael yearns for secure, loyal connections. He values **loyalty, consistency, and engagement** from others, because these make him feel safe and loved. When he bonds with someone – be it a friend or

romantic partner – he invests a lot emotionally and hopes (often silently) that they will be as invested in return. He can become quickly attached and highly attuned to the other person's moods and behaviors. If a loved one seems distant or upset, Michael's first instinct is to worry he might have done something wrong or that he's about to be abandoned. There's an underlying **fear of abandonment and rejection** that makes him vigilant to any sign of displeasure [integrativelifecenter.com](http://integrativelifecenter.com). For instance, if a partner is quieter than usual one evening, Michael might anxiously replay their recent conversations, searching for what *he* might have done to cause it. This anxious vigilance is exhausting, and he recognizes it can be unfair (sometimes a tired mood is just a tired mood, not a looming breakup), but the fear is deeply rooted. It traces back to earlier life experiences – feeling emotionally neglected by caregivers at times, and a few formative incidents of betrayal or loss – which taught him the painful lesson that people you rely on can leave or disappoint you. Thus, whenever he cares about someone, a part of him is braced for that shoe to drop. He often *"worries that his partner will stop loving him"* or that if he reveals his true self, they will dislike or leave him (a worry explicitly reflected in his self-assessments) [file-w3jrnf8wypvmaz7kamsgpfile-w3jrnf8wypvmaz7kamsgp](#). This leads him to sometimes **overthink his interactions**, double-text to check if everything is okay, or seek frequent reassurance, especially in a new relationship.

On the **avoidant side**, ironically, Michael also has a strong impulse to **withdraw and self-protect** when conflict or intense emotions arise between him and someone close. Conflict is particularly triggering to his attachment system. In an argument or if he feels accused, a switch flips where he emotionally *closes off*. In those moments, his demeanor might become distant, his responses curt or non-existent – essentially, he may shut down or even physically remove himself (e.g. leaving the room). This is a classic **deactivating strategy** of an avoidant response: when intimacy feels threatening (like during a heated conflict, when he fears rejection or ridicule), he instinctively tries to **escape the situation to avoid further hurt** [goodtherapy.org](http://goodtherapy.org). He has noted that during arguments with a past partner, he often felt an overwhelming urge to be silent and *"check out"* because continuing to engage felt impossible without breaking down. Unfortunately, this behavior can come off as *stonewalling* or lack of care to the other person, which can frustrate them and sometimes

escalate the conflict. Inside, though, Michael withdraws **not because he doesn't care**, but because he cares *so much* that the conflict is unbearably painful – his system is essentially in panic and the only thing it can do is play dead. Indeed, those with fearful-avoidant tendencies often “crave attention” but also display fear towards their loved ones during intense moments [integrativelifecenter.com](http://integrativelifecenter.com), and they can send mixed signals: pursuing closeness one minute and distancing the next.

A key theme in Michael's attachment pattern is **feeling like a burden**. He hesitates to ask for help or express his needs directly, even when he's struggling. This stems from a deep-seated belief that *relying on others will drive them away* – that if he needs too much or is too vulnerable, he'll overwhelm people. Consequently, he often suffers in silence or tries to solve problems alone, even when a friend's support could really help. For example, if he's having a mental health crisis, instead of calling a friend to talk, he might isolate himself, worried that reaching out would just be bothersome or that he'll be seen as “too much.” This aligns with known patterns of anxious-avoidant individuals: they desperately want support but **fear vulnerability and rejection**, which “hinders the ability to offer and receive emotional support” and creates feelings of loneliness [integrativelifecenter.com](http://integrativelifecenter.com). Michael frequently reports feeling lonely or unloved *despite* having caring people in his life, indicating how this attachment lens filters his perceptions. He might interpret someone's busy schedule as them intentionally avoiding him, or apologize profusely for even minor favors, as if any need of his is an inconvenience. When others willingly help or show care, he is grateful but also somewhat bewildered – a part of him is always waiting for the moment he becomes “too much to handle.”

During conflicts or when he is upset with someone, Michael's reflex is often to **pull away** rather than confront. Conflict terrifies him because it combines his worst fears: possible rejection, anger directed at him, and the risk of losing the relationship. Thus, if a conflict emerges, his avoidant side tends to take over. He might ghost for a day or two, retreat into work, or respond with ultra-logical, detached messages to avoid showing how hurt or scared he is. Unfortunately, this sometimes leaves his friends/partners feeling shut out. On the other hand, if *others* withdraw or give him the silent treatment, it inflames his anxious side – he'll panic and chase reassurance. This creates a painful loop common in anxious-avoidant dynamics [goodtherapy.org](http://goodtherapy.org) [goodtherapy.org](http://goodtherapy.org): fearing each

other's reactions, partners can trigger each other's insecurities (one pursues, the other distances). Michael is aware of this pattern now and is trying to slowly break it by *communicating* more openly. It's extremely challenging for him to voice his needs or fears (years of habit tell him to just "deal with it himself"), but he has made small strides like telling a partner, "I need a little time to process, but I'm not leaving; I just need a breather," instead of disappearing with no explanation. He also consciously reminds himself that **healthy relationships require vulnerability** and that the right people *want* to be there for him.

Michael's attachment struggles clearly tie back to earlier life experiences. **Inconsistent caregiving and emotional neglect** in childhood taught him that emotional needs might not be met, leading to his belief that he shouldn't burden others and his difficulty trusting [supportintegrativelifecenter.com/integrativelifecenter.com](http://supportintegrativelifecenter.com/integrativelifecenter.com). At the same time, those experiences left him with a profound hunger for the very support he lacked, hence the anxious desire for closeness. Past betrayals or losses (like a very close friendship in adolescence that ended painfully) further reinforced the idea that letting people in can result in getting hurt, hence his impulse to run at the first sign of trouble. Understanding this origin helps Michael be kinder to himself about these patterns – he now sees them as *learned survival strategies* rather than personal failings. This trauma-informed perspective is guiding him in therapy and self-work to gradually develop a **more secure attachment**. He practices reminding himself that he is worthy of love and that good relationships *can* endure conflict. He's also learning to set small tests of trust: for example, asking a friend for a modest favor and experiencing that they don't hate him afterward, or expressing a dissenting opinion and seeing the relationship survive. Each positive experience chips away at the old narrative that he's a burden or that conflict = abandonment.

In summary, Michael's interpersonal life is characterized by a **yearning for deep connection clashing with a fear of depending on others**. He loves profoundly and is fiercely loyal, but he may hold back parts of himself out of fear. His ideal is a partnership or friendship where both people are emotionally **safe havens** for each other – where he never has to doubt the other's support, and they in turn feel his unwavering support. Achieving this means continuing to challenge his attachment fears, communicating openly

even when scared, and choosing partners/friends who are patient and understanding of his needs. Encouragingly, Michael's increased self-awareness is already helping him break old cycles. He now recognizes the "anxious voice" vs "avoidant voice" in his head and can sometimes pause to decide his response instead of reacting automatically. This deliberate effort is the beginning of an **evolving attachment style**, hopefully moving from insecurity toward security as he heals.

## Core Beliefs and Identity: Reconciling Self-Image

At the heart of Michael's psychology lies a battle of **core identity beliefs**. On one side are his positive values and aspirations – he genuinely sees himself as *"someone who wants to create and understand."* He knows he is intensely curious, imaginative, and driven by a desire to produce meaningful work and insights. This manifests in his passion for the arts and education: Michael finds purpose in **creating art, sharing knowledge, and connecting with others through storytelling and teaching**. These pursuits align with an internal belief that his life's meaning comes from creativity, learning, and contributing something of value to the world. Indeed, those close to him would describe Michael as exceptionally creative, thoughtful, and insightful. He often assumes the role of the **meaning-maker**, whether it's crafting a narrative for a film project or helping a friend find perspective on a personal problem. Deep down, he holds a belief like *"I am a person who can see beauty and significance in the world, and I want to add to it."* This reflects a **positive core schema** about himself as capable of creation and understanding.

However, opposing this is a shadowy set of **negative core beliefs** that Michael has carried from early on: the notion that he is fundamentally **unlikable, inadequate, or bound to disappoint**. These beliefs whisper to him that no matter what he does, there's something *intrinsically wrong* with him that others will eventually see. In social situations, this may translate to a persistent background thought of *"I bet they secretly don't want me here"* or *"I'm going to say something stupid and they'll realize I'm not worth their time."* In professional or creative situations, a similar imposter syndrome crops up: *"I'm not really that talented; it's only a matter of time until I fail and everyone knows I'm a fraud."* These thoughts reveal an entrenched **lack of self-worth**.

Psychology notes that core beliefs can be very rigid and often "not based on

evidence" – for example, a person might see themselves as unlikable even when they have many friends[medicalnewstoday.com](http://medicalnewstoday.com). Michael exemplifies this: the negative view of self persists despite external evidence of his likability (he has close friends, mentors, and collaborators who think highly of him). It's as though positive feedback or success slides off the surface of his mind, while criticisms and failures sink straight to the core, reinforcing his worst beliefs.

These negative beliefs did not arise from nowhere; they are rooted in Michael's formative experiences. **Childhood emotional neglect** likely planted the seed of "*I'm not important or lovable*" – when a child's emotional needs aren't adequately met, they often conclude that the fault lies in themselves (e.g. "If I were good or lovable, my parent would pay attention/comfort me, so something must be wrong with me"). Consistent with this, childhood neglect is known to undermine self-esteem and self-worth[psychologytoday.com](http://psychologytoday.com). Michael remembers feeling "invisible" or "not worth noticing" at times growing up, feelings that fused into a belief of **being unworthy of attention or care**. **Bullying and social rejection** in adolescence further solidified the belief that he was unlikable – peers' hurtful words (calling him weird, making him the butt of jokes) seemed like proof that everyone saw some defect in him. Such experiences containing "*lies about your worth*" often cause people to lose confidence and believe those lies[parents.com](http://parents.com). Even though he has long since left those bullies behind, their voices still echo internally when he's feeling low. Additionally, **high expectations and criticisms from authority figures** (like teachers or directors who were hard to please) contributed to an internal narrative that "*I'll never be good enough.*" Michael internalized others' disappointment such that even now he often preemptively assumes he's a disappointment.

The clash between Michael's *aspirational self* and his *wounded self* creates a lot of inner tension. For example, he strongly values creating meaningful art (aspirational self says "I have a vision and talent to share"), but when he sits down to work, the wounded voice might chime in ("No one will care about this, you're not actually talented"), leading to procrastination or creative block. Or in relationships, his true self desires deep love and knows he can be a devoted, caring partner, but his insecure self undermines with "they'll leave once they see the real you" – causing him to hold back or act insecure, which ironically can strain the relationship. This self-sabotaging loop is something Michael has

become more aware of recently. He describes it as *"knowing logically that I have worth, but not feeling it emotionally."*

A major part of Michael's current journey is **reconciling these dueling identities** and healing his core self-image. He is actively working to update his internal narrative to reflect reality more than trauma. One strategy he uses is cataloging positive feedback and experiences: for instance, saving kind messages from friends or reminders of accomplishments. When the "I'm unlikable" belief flares up, he can look at evidence – *"X friend has stuck by me for years and values my company,"* or *"I directed a play that moved people to tears, so I must have done something right"* – to challenge that belief. This is essentially a cognitive-behavioral approach to reshaping core beliefs by **confronting the distortions with facts**. It's not easy; as noted, core beliefs are inflexible and won't vanish overnight. But Michael has had moments of insight where he genuinely feels *"Maybe I'm not fundamentally broken... maybe I'm a decent person who had some bad things happen."* These moments are emotionally powerful and healing, like cracks of light breaking through a long dark room.

Michael is also exploring the idea that both the positive and negative narratives are part of him, and neither needs to be denied. Instead of viewing it as a battle to the death between good self-esteem and bad self-esteem, he's experimenting with **self-acceptance**: acknowledging his flaws and wounds while still embracing his strengths and worth. For example, accepting that "I can be awkward and insecure sometimes, and that's okay; it doesn't erase the fact that I'm also thoughtful and kind." This more nuanced self-view is slowly reducing the whiplash between thinking he's *awesome* one day and *terrible* the next. He's learning that he can be a work-in-progress and still worthy of love and respect.

In essence, Michael's core identity is **coalescing** into something more balanced. The part of him that "wants to create and understand" is being reinforced as he takes pride in his creative projects and intellectual pursuits, while the part that feels "disappointing" is being soothed and disproven through positive relationships and achievements. He still has rough days where the negative beliefs dominate – times when a criticism or setback sends him into that spiral of self-doubt. But even then, he is quicker to recognize, "This is my trauma talking. This feeling isn't forever." He's gradually internalizing new

core beliefs, like “I am capable of growth” and “I have people who love me as I am,” to counter the old ones. As these healthier beliefs take root, Michael’s sense of identity is becoming more resilient and authentic: he can see himself as the multi-faceted person he truly is – creative *and* occasionally scattered, kind *and* at times anxious, intelligent *and* still learning. Embracing this complexity is a sign of his evolving self-awareness and healing.

## Perfectionism, Failure, and the Weight of Expectations

Michael’s relationship with **failure and achievement** is fraught with perfectionism and internalized high standards. He intellectually acknowledges that “*failure is essential to growth*” – in theory, he believes in the value of learning from mistakes and has even advised others that nobody succeeds without stumbling along the way. However, when it comes to himself, failure (or even minor mistakes) tend to trigger significant distress and overanalysis. This is a classic hallmark of **perfectionism**: knowing that being perfect is unrealistic, yet feeling a compulsion to try anyway and a deep shame when falling [shortsummer.harvard.edu](https://shortsummer.harvard.edu).

From a young age, Michael absorbed the message that **anything less than perfect is failure**. Whether this came from external expectations (e.g. trying to please parents/teachers) or his own drive, the result is an internal voice that sets an almost impossibly high bar for everything he does. If he can’t reach that bar, instead of acknowledging the progress or partial success, he often zeroes in on the gap and deems himself a disappointment. For instance, if he gave a presentation that 95% of the audience loved but one person had a critique, Michael will fixate on that one critique as evidence the whole thing was a flop. In his academic life and creative projects, this meant that **doing his best never felt enough** – an A- would bother him if an A+ was achievable, or finishing second place felt like failure if first place was in sight. As a result, he is **highly self-critical** of his performances [summer.harvard.edu](https://summer.harvard.edu). He rarely celebrates his wins for long, because his mind quickly moves the goalposts: “*Yes, I did well, but I could have done even better.*” Over time, this erodes his sense of accomplishment and can make even objectively good outcomes feel hollow.

A consequence of this perfectionism is **chronic overthinking and brain fog** when he faces tasks of high importance to him. Because he's so anxious about doing them perfectly, he can become paralyzed by analyzing every angle (for example, endlessly researching to ensure an essay is flawless, or repeatedly second-guessing a design choice in a project). This overanalysis often leads to procrastination – a known link, as perfectionists often put off starting tasks out of fear they won't be able to do them perfectly. [summer.harvard.edu](https://summer.harvard.edu). Michael definitely experiences this: if a project is important (say, a video that he wants to be his "masterpiece"), he might delay beginning it for days or weeks. On the surface this looks like procrastination, but underneath it's the **fear of failure** that holds him back. It feels safer not to start than to start and possibly not meet his own lofty expectations. In some cases, he has missed opportunities or let deadlines pass because of this paralyzing fear – afterwards berating himself for "choking" but not fully recognizing that it was his perfectionism setting an unworkable standard that caused the freeze. Research on perfectionism shows it often comes with exactly this pairing of "*fear of failure*" and *procrastination*. [summer.harvard.edu](https://summer.harvard.edu).

Additionally, Michael carries **internalized expectations** that feed his perfectionism. He often feels he *must* achieve great things to be worthy – possibly a narrative derived from trying to win approval in childhood or to stand out in a large family. He put pressure on himself to be the "exceptional" one (straight A's, accolades in theater, etc.), thinking that was the way to earn love and respect. While this drove him to accomplish a lot, it also meant his self-esteem became heavily tied to performance. Thus, a failure isn't just about the task; to Michael, it can signify *he* is a failure as a person. This all-or-nothing self-judgment is extremely painful. For example, when he was fired from a theater job (in a situation that arguably wasn't entirely his fault), he internalized it as "*I am worthless as a professional*" and it took a long time to recover a sense of competency. Even small failures, like forgetting an appointment, can set off disproportionate shame, because in his mind it confirms the negative belief that "*I'm irresponsible and letting people down.*"

Yet, interestingly, Michael simultaneously advocates the **growth mindset** concept that mistakes are how we improve. He admires people who can fail gracefully and try again. Part of him aspires to that. This shows that

his *rational mind* understands the healthy approach, but his *emotional conditioning* hasn't fully caught up. He often describes a feeling of "*knowing what I should feel or do, but not being able to get there.*" For instance, after a setback he might tell himself all the right things – "*It's okay, you'll learn from this, nobody succeeds all the time*" – yet still feel crushed and find it hard to move forward. The **emotional weight of failure** for him is immense, often tied up with fear of judgment from others (and himself). Indeed, in perfectionism "failing may result in friends thinking less of you or losing opportunities"[summer.harvard.edu](http://summer.harvard.edu) – these are precisely the catastrophic outcomes his mind imagines. He worries that one failure will make others lose faith in him or that he'll never get another chance, which adds intense pressure to each endeavor.

This perfectionism has also contributed to mental "**fogginess**" at times. When he is overthinking and anxious about doing something perfectly, his mind can become so overloaded that he actually can't think clearly at all. He's described sitting at his computer to write, with dozens of thoughts and self-critiques swirling so fast that he ends up staring blankly or mindlessly scrolling a website (distracting himself to escape the pressure momentarily). It's a kind of analysis paralysis where the cognitive load of trying to be perfect short-circuits productive thought.

Michael is actively trying to **reframe his relationship with failure**. Through therapy and self-reflection, he's acknowledged that his standards, while motivating, can also be unrealistic and self-defeating. He's come to see how his harsh inner voice mirrors voices from the past and that he can choose to develop a kinder inner voice going forward. One practical step he's taking is to **set more realistic goals** and explicitly permit himself to be "*good enough.*" For example, if he's writing an article, he might say: "I'm going to aim to write 1000 words today even if they're not perfect, rather than expecting 2000 perfect words." Then he practices stopping when he hits that attainable goal and treating it as an accomplishment. This directly combats the never-enough cycle.

He's also working on **exposure to failure** in small doses to build tolerance. This can be as simple as deliberately doing something he knows he's not great at (like playing a sport casually) and noticing that the world doesn't end if he's not excellent – he can even have fun being average. Each time he survives a

"failure" or imperfection and sees that it doesn't annihilate his worth or relationships, it erodes the fear a little more. He's also learning to dissect failures for lessons without the self-shaming. Instead of "I screwed up, I'm awful," he's trying to say "Okay, I screwed up – *why?* and what can I do differently next time?" This shifts the focus to growth (the very growth he conceptually believes in) and away from personal deficiency.

Michael's perfectionism is gradually softening as he internalizes that **nobody who achieves anything meaningful does so without setbacks**. In fact, some of his personal heroes (like certain authors or filmmakers he admires) have spoken about their failures, and he's been using those examples as reminders. He now keeps a kind of "failure resume" inspired by an idea he read – listing rejections or flops he's experienced and what they taught him – to normalize it for himself. This exercise has been oddly liberating; seeing it on paper demystifies failure and even highlights how some failures led to later successes or redirections that were beneficial.

In conclusion, Michael is in the process of **unlearning perfectionism** and embracing a healthier approach to achievement. It's an ongoing effort with two steps forward, one step back. But he is more aware than ever of how perfectionism has been "hurting him" by binding his self-worth to impossible standards [summer.harvard.edu](http://summer.harvard.edu). By consciously redefining success (e.g. including effort and improvement, not just outcome) and permitting himself to be human, he's slowly breaking the spell that failure had over him. As he does so, he finds more mental clarity and courage to pursue his goals – after all, when the fear of failure loosens its grip, creativity and initiative have more room to flourish.

## **Creative Drive, Preferences, and Flow States**

Creativity is at the core of Michael's identity. He has a rich imaginative life and a knack for infusing meaning and emotion into whatever he creates – be it a photograph, a piece of writing, a performance, or a lesson plan. **Poignancy, humor, meaning, and connection** are the hallmarks of the creative work Michael both produces and is drawn to. He loves storytelling or art that can make you laugh one moment and tear up the next, that says something true about the human condition, and that forges an emotional bond with the

audience. These preferences show up in the projects he chooses and his style of creation. For instance, when writing a short film script, he gravitated towards a bittersweet narrative with comedic touches rather than a straightforward comedy or a purely abstract piece. He often cites creators like **John Green** (known for heartfelt yet humorous storytelling) as inspirations, which reflects his love for that blend of **depth and levity**. In whatever medium he's working, Michael strives to make people *feel* something real and to find the meaningful threads in everyday experiences.

At the same time, Michael recognizes that his creative process can be quite **freeform and exploratory**, which has pros and cons. On the positive side, he's great at brainstorming, improvising, and finding unexpected connections – his mind happily generates a flurry of ideas, and he's willing to follow a whim to see where it goes. This openness and playfulness is part of what makes him a versatile artist. However, the downside is that without some **structure or focus**, his creative energy can become scattered. He has many half-started projects or ideas that never came to fruition because he got distracted by the next exciting concept or lost focus when the work became tedious in later stages. Michael has learned that he "prefers exploration but needs structure to focus [his] improvisation." In practice, this means he benefits from frameworks or constraints to channel his creativity. For example, if he's editing a video, having a clear outline or storyboard (even if loosely defined) helps him actually complete the edit, rather than endlessly tinkering. If he's writing, setting a rule like a specific format or deadline can rein in his wandering imagination just enough to get it done. He has a bit of a paradoxical relationship with structure: he resists it because he loves freedom, but he also realizes **too much freedom can lead to lack of completion**. As such, he often oscillates between periods of wild creative brainstorming and periods of disciplined editing/refining. When he finds the sweet spot between the two – structure that doesn't stifle, and spontaneity with some order – he produces his best work.

Michael experiences **flow states** most readily in certain creative and interactive activities. Notably, he often enters a state of energized focus and loss of time when he is:

- **Teaching or Mentoring** – Standing in front of a class or working one-on-one to explain concepts (especially in theater or photography) can absorb

him completely. He loves the improvisational aspect of responding to students in the moment and the reward of seeing a concept click for someone. In these moments, he's not overthinking; he's fully present and *engaged*, often surprising himself with the clarity or creativity of his own explanations. Teaching combines his desire to connect with others and his creative storytelling, putting him in flow.

- **Video Editing and Design** – The process of editing video or doing graphic design pulls him in deeply. He has described spending 8-10 hours straight editing a short film, hardly noticing the time passing or even forgetting to eat. The combination of technical skill and artistic decision-making required in editing suits his detail-oriented yet creative mind. He enjoys tweaking timing, music, and visuals to evoke just the right emotion, and when it's going well, it becomes almost meditative. This aligns with the concept of hyperfocus in ADHD, where if the task is sufficiently stimulating, he can maintain concentration for extraordinary lengths [healthline.com](https://www.healthline.com). Editing provides constant feedback and rewards (each cut or effect immediately changes the feel, which is gratifying), feeding his interest-based attention.
- **Directing/Producing** – When he's directing a play or a photoshoot, he enters a flow of orchestrating many elements towards a vision. He thrives on the multi-dimensional challenge of it – managing actors' performances, visual setups, timing, etc. It's high-pressure, but because it's creative and meaningful to him, it actually sharpens his focus rather than causes paralysis. Those who've worked with him observe that he's remarkably calm and in-the-zone during a show or event, even if he was anxious leading up to it. It's as if once he's *in* the creative performance moment, his anxiety quiets and intuition takes over.

During these flow activities, Michael's **motivation is at its peak**, driven by genuine passion and interest. This reinforces what we noted in the ADHD section: he has an *interest-based nervous system*. When a task carries **personal meaning, novelty, or emotional resonance**, he can harness incredible motivation and productivity; whereas tasks motivated purely by obligation or logic (with no emotional hook) tend to languish. He often says that trying to force himself to work on something he "doesn't feel" is almost impossible – for example, attempting to study a dry subject just because it's

important will be a losing battle, but give him a compelling reason or a way to make it fun, and he'll dive in. This is consistent with ADHD expert descriptions: an ADHD brain isn't motivated by "this *should* be done" but by "this *sparks my interest*"[laconciiergepsychologist.com](http://laconciiergepsychologist.com). Michael's emotional drive is his rocket fuel. If he emotionally cares about a project or finds it fascinating, he'll pour hours into it willingly. If not, no amount of guilt-tripping himself will produce the same result. Recognizing this, Michael has started to "negotiate" with his own brain – attaching personal meaning to tasks that initially don't have it. For instance, if he has to do a boring work report, he might reframe it as "*This report will help the team succeed and reduce stress for everyone (connection), and I can treat it like a story with data*", essentially trying to spark some interest via reframing.

**Feedback sensitivity** is another element of Michael's creative life. Because he pours so much of himself into his work, feedback on that work can feel very personal. Positive feedback absolutely lifts him up – he's exhilarated when his creation resonates with people, which boosts his motivation to create more. A single sincere compliment about his art can make his whole week, reinforcing the positive core belief that he *does* have something of value to offer. On the flip side, **negative feedback or criticism** (even well-intentioned and constructive) can sting disproportionately. It can momentarily confirm his self-doubts, sending him into a spiral of revisiting every perceived flaw in the work (or himself). This is tied to the RSD and perfectionism discussed earlier. He's working on separating his *work* from his *worth* – telling himself that a critique of a project is not a critique of him as a person. In collaborative creative settings, he's making progress here: he can now take an actor's or editor's feedback and grudgingly admit they have a point without feeling utterly defeated. He reminds himself that **feedback is a tool for growth**, not an attack. It helps that he genuinely wants to improve; the trick is tempering the initial emotional reaction so he can use the feedback constructively. Over time, repeated experiences of surviving feedback and actually implementing it to make his work better have started to build confidence. He's noticed that sometimes what he thought was a "harsh" criticism was actually the gateway to a breakthrough in his art – so now he tries to view feedback as part of the creative process rather than a final verdict.

In terms of **creative collaboration**, Michael shines when he's with people who share his enthusiasm and are open-minded. He loves bouncing ideas off others, building on suggestions, and collectively finding the best path. His attachment fears can initially make him shy to put forth his wild ideas in a new group (fear of rejection), but in a trusted team he becomes a fountain of ideas and a strong facilitator of others' contributions. In fact, colleagues often appreciate that he encourages everyone's input and forges a sense of camaraderie – he wants everyone to feel connected through the creative process (that connection piece again). If anything, one thing to watch is that he might yield too much to others' ideas at times to avoid conflict, even if his intuition says otherwise. As he grows more confident, he's learning to assert his creative vision when it matters, while still valuing collaboration.

In summary, **creativity is both sanctuary and expression** for Michael. It's where many of his strengths – empathy, imagination, intellect – converge, and where some of his challenges – distractibility, self-doubt – find constructive outlets. When he's creating, at his best, he experiences a sense of **flowing alignment**: he is present, authentic, and free. His evolving maturity is helping him bring gentle discipline to his creative chaos, making it more likely that his beautiful ideas see the light of day. Likewise, he's learning to take feedback in stride and share his creative self more fearlessly. The ongoing goal for Michael is to nurture an environment (both around him and within him) that lets his creative passions flourish without being quashed by overcritical or unfocused tendencies. Given his talent and drive, as he continues balancing structure with exploration, he is likely to produce work of even greater depth and impact – something that is deeply fulfilling to him, as creating meaning is what he feels he was born to do.

## Coping Strategies and Sources of Support

Navigating the rollercoaster of intense emotions, ADHD challenges, and negative thoughts, Michael has developed an array of **coping tools** to help manage his mental health and maintain balance. These tools range from creative outlets to physical activities to social support, reflecting his understanding that effective coping for him is holistic – engaging mind, body, and heart. Below is a summary of Michael's key coping strategies and what each provides him:

**Table: Michael's Coping Tools and Their Benefits**

Coping Tool	How Michael Uses It / Benefit
<b>Music (listening or playing)</b>	Music is Michael's go-to emotional regulator. Curating playlists for different moods, he uses music to <b>cathartically release feelings</b> or lift his spirits. For example, during anxiety he might play calming instrumentals, and when sad, he might lean into a poignant song that lets him have a healing cry. Music provides an immediate emotional outlet and often helps him feel understood (lyrics that resonate) and less alone.
<b>Walks in Nature</b>	When overwhelmed or stuck in rumination, Michael finds a simple <b>walk outdoors</b> incredibly grounding. The rhythmic movement, fresh air, and change of scenery help <i>reset</i> his nervous system. Walking has a meditative effect – he can process thoughts or, sometimes better, give his brain a break by observing the environment. Research shows that even mild exercise and being in nature reduces stress and improves mood, which he certainly finds true for himself. After a 30-minute walk, his head usually feels clearer and his body less tense.
<b>Art-Making (drawing, photography, etc.)</b>	Creating art purely for himself (not for work) is a therapeutic tool Michael uses to <b>process emotions non-verbally</b> . Sketching, doodling, or snapping photos allows him to express what's inside without needing to articulate it in words. Often the colors or imagery he produces reflect what he's feeling – it's a form of journaling in images. The act of creation is soothing in itself, giving him a sense of flow that distracts from stress. And the end product, whether it's a quick drawing or a set of photos, gives him a visual representation of "I made something out of what I felt," which can be empowering.
<b>Journaling &amp; Reflective Writing</b>	Writing is one of Michael's powerful reflective practices. He keeps journals where he <b> dumps out his thoughts and feelings</b> , especially during tough times. This helps him in several ways: it vents the racing thoughts onto paper (providing relief), it brings structure to internal chaos by putting experiences into language, and it often yields personal insights. Journaling has known benefits for mental health – studies have linked it to decreased distress and better emotional regulation <a href="https://www.webmd.com">webmd.com</a> , something Michael has experienced firsthand. Even if he doesn't write daily, when he does, he usually ends the session feeling lighter or having a clearer perspective on his problems. Sometimes he also does " <i>reflective</i>

	<i>cataloging</i> ," for example writing lists of what went well in a week or memorable moments; this practice reinforces positive memories and tracks growth.
<b>Talking with Family (Father especially)</b>	<b>Emotional support from family</b> is a cornerstone of Michael's coping. In particular, his father has become a reliable source of comfort and guidance. When Michael is in distress, a phone call or visit with his dad often helps him <b>feel safe and heard</b> . His father provides a non-judgmental ear, reassurance of Michael's worth, and often some practical advice or perspective from experience. Knowing that his dad is firmly in his corner gives Michael strength to face challenges. Additionally, Michael remains close to his grandmother ("Grandpatty"), whose unconditional support and creative inspiration have anchored him since childhood. Leaning on family in times of need reminds Michael that he <i>is not alone</i> and that he has a safety net. This social support has proven to buffer him against stress and is a key factor in his resilience.

Each of these tools plays a role in Michael's self-care routine. For example, a typical difficult day might find him **journaling through tears in the morning to vent anxieties**, then taking a **midday walk** to shake off the cobwebs, listening to an **uplifting playlist** on that walk to shift his mood, perhaps drawing or collaging images in the afternoon to channel lingering feelings, and finally **calling his father** in the evening to talk things through and get encouragement. Not every day allows time for all of these, but he intuitively picks what he needs in the moment. Importantly, these coping mechanisms are largely healthy and constructive – a fact he's proud of, given that earlier in life he sometimes coped through more harmful means like excessive video gaming or just sheer denial. Now, he proactively turns to these positive outlets when he notices his mental health sliding.

**Humor and media** are additional coping facets worth noting. Michael has a rich sense of humor and often uses laughter as a release valve. Whether it's watching an episode of a favorite comedy show or joking with friends, humor helps him momentarily distance from pain and gain a lighter perspective. He's a big fan of shows like "*The Office*" or "*Parks and Rec*" – heartwarming comedies that reliably cheer him up when he's down. Similarly, he finds solace and inspiration in **stories** (books, movies) that resonate. Immersing himself in a

fictional world can be a healthy escape that returns him to his own life with a refreshed mindset or even insights gleaned from the story's themes.

Another coping strategy is **organization and cataloging as reflection**. While routine maintenance is hard for him, during certain moments of clarity he enjoys organizing his thoughts or life events in structured ways – almost like personal analytics. For instance, he might create a mind-map of what's bothering him, or update a Notion page where he tracks personal goals or lessons learned. The act of organizing gives him a sense of control when life feels chaotic. It's also tied to his love of narrative frameworks (addressed more in the next section) – essentially, he copes by finding or creating *story and structure* in what he's going through.

It's important to mention that coping is not all solitary for Michael. While he often initially withdraws when upset (due to the fear of burdening others), he has realized that **reaching out** is crucial. Besides family, he has a couple of close friends he trusts enough to call when in crisis. Breaking that barrier to ask for help is always hard, but when he does, he invariably feels grateful. Those friends can usually talk him through the worst waves of emotion or at least sit with him in it. He's slowly learning that leaning on loved ones in hard times actually strengthens bonds rather than breaks them. Each time a friend responds with kindness rather than annoyance, it challenges his belief that he's a burden.

In terms of professional coping tools, Michael has engaged in **therapy** in the past and found it beneficial. A therapist provided him a safe space to unpack trauma and learn new skills (like some of the cognitive reframing and mindfulness techniques he now uses). He isn't currently in regular therapy, but he uses many of the lessons learned – such as identifying cognitive distortions, practicing grounding exercises (e.g. the 5-4-3-2-1 sensory technique to combat panic), and even just the habit of *self-reflection* which therapy encouraged. He's open to returning to therapy whenever he hits a roadblock he can't navigate alone.

Lastly, **self-compassion practices** are emerging in his coping repertoire. This is newer and still uncomfortable for him, but he's trying things like guided meditations or writing compassionate letters to himself (yes, literally writing "Dear Michael" and offering himself kindness as if he were a friend). Though

initially skeptical, he's found these exercises surprisingly emotional – in a good way, like balm on a wound he didn't realize was so raw. Developing self-compassion is probably one of the most healing coping strategies for Michael, as it addresses the root of a lot of his pain (his harsh self-judgment). It's a slow journey to cultivate kindness toward himself, but each time he manages to do it, he feels a notable decrease in stress and an increase in hope.

In summary, Michael's coping toolbox is diverse and effective. He leverages **creative expression, physical movement, reflective writing, humor, and social connection** to navigate life's challenges. These tools not only help him survive tough moments but also contribute positively to his personal growth. Through music, art, and writing, he converts pain into something meaningful. Through walks and reaching out to loved ones, he releases tension and reconnects with the world. And through introspection and occasional therapy tune-ups, he continues building resilience. By actively using these strategies, Michael has managed to stay afloat and make progress even when storms hit. They are a testament to his resourcefulness and determination to heal.

## Trauma and Healing Journey

Beneath Michael's present-day challenges and behaviors lies a landscape of **unresolved trauma** from earlier in life. A number of painful experiences in childhood and adolescence have left emotional scars that still influence him in adulthood. These include **parental neglect and family dysfunction, bullying and social exclusion**, chronically **unsafe emotional environments**, and a particularly scarring incident of **being unjustly dismissed by a trusted authority figure**. Understanding these trauma sources is vital, as they provide context for Michael's intense sensitivity, attachment anxieties, and core beliefs described above. Importantly, Michael has increasingly begun to confront and heal these wounds, adopting a trauma-informed approach to his own psychology – recognizing that many of his struggles are *logical responses to what he went through*, and that with compassion and support, he can work through them.

One foundational trauma was **emotional neglect in his early family life**. Michael grew up in a period where his parents' marriage was falling apart and

eventually ending. During and after his parents' divorce, he often found himself **emotionally adrift**. His mother, dealing with the upheaval and working long hours, was frequently preoccupied or unavailable to attend to Michael's emotional needs. He spent many afternoons and evenings in the back of her workplace, alone with his imagination, which, while fostering creativity, also meant he **felt very isolated and unseen**. There were no overt abuses; rather, it was the absence of sufficient nurture – a quiet, invisible trauma often termed **childhood emotional neglect**. This left young Michael with the implicit belief that his feelings didn't matter or that he had to handle distress alone. Psychology experts note that emotional neglect can severely undermine a child's self-worth and ability to understand their own emotions [psychologytoday.com](https://www.psychologytoday.com). In Michael's case, he emerged from childhood not fully knowing how to self-soothe or express needs, and harboring a lingering void of *"something was missing."* This void later manifested as depression in middle school and that chronic feeling of unworthiness.

Compounding this was the presence of **dysfunction and instability after his mother's remarriage**. His stepfather struggled with alcoholism and health issues, which created an environment of unpredictability and tension at home. Michael as a sensitive pre-teen often felt on edge, never sure when an outburst or crisis might occur. The household atmosphere was one where expressing vulnerability felt unsafe – there was already too much chaos, so he likely bottled up his own fears and sadness. This period taught Michael to be **hyper-vigilant** (constantly monitoring others' moods, anticipating problems) and to avoid rocking the boat. Such an environment is a form of chronic trauma that keeps a child's nervous system in a prolonged state of high alert. Even now, Michael can be startled by anger easily or feels deeply uncomfortable around conflict, likely tracing back to walking on eggshells during those years.

School life offered little refuge, as Michael faced **bullying and social trauma** particularly in late elementary and middle school. Moving to a new school after the divorce, he struggled to fit in. He was a creative, quirky kid – traits that in a cruel twist made him a target for bullies who pick on anyone different. He endured teasing about his interests and appearance, exclusion from peer groups, and even betrayal by friends. One especially painful experience he often recalls is an **8th-grade friendship** that ended in a hurtful way (the friend perhaps turned on him or abandoned him under peer pressure).

Being **betrayed by someone he trusted at that age** left a deep imprint: it confirmed his fear that if you open your heart, it can be broken. Bullying and exclusion delivered blows to his self-esteem, reinforcing the belief that he was *unlikable* or “too weird” – echoes of which still surface in his negative self-talk. Research validates that being bullied can cause long-term harm to self-image and lead to feelings of worthlessness well into adulthood [linkedin.com](https://www.linkedin.com). For Michael, those adolescent wounds are at the root of some of his social anxiety and need for assurance in relationships.

Another trauma thread is **feeling dismissed or invalidated by authority figures** in pursuits that meant a great deal to him. The notable incident of being fired from a theater position is a prime example. Theater was Michael's sanctuary and passion; he poured countless hours and his soul into it from youth. At one point in his late teens or early adulthood, an authority (perhaps a director or administrator) abruptly terminated his involvement, in a manner he experienced as deeply unjust and humiliating. This event was traumatic on multiple levels: it was public (others saw him being cast out, feeding shame), it involved betrayal of trust (someone he respected turning on him), and it attacked his identity (art and theater were his identity, and being told “you’re not wanted here” struck at his core). It’s no surprise that after this, Michael developed a pronounced fear of authority figures and greater self-doubt in professional spheres. He may subconsciously fear any mentor or boss will eventually “see something bad in me and kick me out,” replaying that trauma. Additionally, this incident contributed to his perfectionism and workaholicism – he resolved to never give anyone a reason to discard him again, even if in reality the firing wasn’t due to a true failing on his part.

Amidst these traumatic experiences, Michael also had protective factors – especially the steadfast love of his **grandmother and eventually his father**. His grandmother provided warmth, encouragement, and a safe creative outlet (she introduced him to arts and local culture). She was one person who saw him and adored him unconditionally, which likely kept a part of him secure even during the chaos. Likewise, as he grew older, his father became more involved and supportive, mending some early gaps. These relationships were crucial lifelines: they offered a model of secure love that Michael could hold onto and that now, in adulthood, he can use as a template for what “safe” relationships feel like. In trauma recovery, having even a single figure who provides

consistent support can make a huge difference – and for Michael, his grandmother (“Grandpatty”) and father served that role.

Now in his mid-20s, Michael is actively engaged in a **healing journey** to address these past traumas. A big part of this is simply **acknowledging that they were traumas**. For years, he downplayed some of these events (as many trauma survivors do): e.g., “My parents’ divorce wasn’t that bad, lots of kids go through it,” or “I should be over middle school bullying by now.” Recently, he’s allowing himself to call a spade a spade – recognizing that yes, those experiences hurt him deeply and left marks that don’t just vanish without care. This validation of his younger self’s pain is an important healing step, as it lets him feel compassion for himself instead of shame for “lingering on the past.”

Michael has been using multiple avenues for healing: therapy (when accessible), self-education on trauma (reading books, articles to understand how trauma affects the brain and behavior), and creative catharsis. For example, he has written personal essays reflecting on those periods of his life – by narrativizing his story, he’s making sense of it and reclaiming power over it. He also finds **community in neurodivergent and mental health support groups online**, realizing he’s not alone in these struggles. Hearing others talk about childhood neglect or RSD or trust issues, and seeing parallels in his own life, has been validating and given him ideas for coping and growth.

A notable focus area is **inner-child work**. Michael, guided by therapy or literature, sometimes imagines comforting his younger self – that lonely boy in the office lobby or that sobbing teen after being bullied – and giving him the love and reassurance he didn’t get then. It might sound abstract, but he’s found it profoundly healing to symbolically “re-parent” himself: to mentally provide the warmth and understanding that was missing. This helps to fill the emotional void left by neglect and builds his capacity to nurture himself.

Michael is also addressing the **belief systems that trauma instilled**. We’ve discussed how neglect told him “you’re not worth attention,” bullying told him “you’re unlikable,” etc. In healing, he’s actively working to dismantle these toxic beliefs. Through journaling exercises, he sometimes writes out each negative belief and then writes a counterstatement that a compassionate observer might say. For instance, to counter “I’m unlovable,” he writes “I am lovable; the proof is in the friends and family who care about me.” He might recall specific

examples (like his father showing up for him at an important event) to reinforce the new belief. This is essentially **cognitive restructuring** from a trauma-informed angle, and over time repetition of these countering truths is helping budge his internal narrative.

Another facet of his healing is learning to **trust again and set boundaries**. Because trauma made trust hard, Michael is gingerly practicing giving trust to those who earn it and distinguishing between trustworthy individuals and those who are not – rather than assuming everyone will hurt him or, conversely, trusting too quickly and getting hurt. Simultaneously, he's learning that boundaries are a way to create safety for himself. As a child he had no control over toxic situations; as an adult he can choose to limit contact with people who belittle him or speak up when he feels disrespected. Recently, he set a boundary with an acquaintance who often made jokes at his expense – something he would have nervously laughed off in the past. By calmly telling them he doesn't appreciate those jokes, he stood up for little Michael inside who couldn't stand up to the bullies. Acts like this are deeply empowering and healing, showing that *now* he has agency to protect himself in ways he couldn't before.

It's worth noting that healing is not linear for Michael. There are periods where old wounds flare up – a certain situation might trigger flashbacks of feelings from childhood (for instance, a boss's angry tone might send him emotionally back to when his stepfather yelled). In those moments, he sometimes feels like that scared kid again, and his reactions (shutting down, panicking) follow suit. But the difference now is he can often *recognize* when he's been triggered and understand, "Ah, this is that old trauma echo." That awareness alone starts to break the power of the trigger, because he can separate past from present more. He can remind himself, *"I'm not actually 12 again, I'm here and now, and I have tools and support."*

Michael's healing journey also involves a lot of **grief** work. He's allowing himself to mourn the childhood he didn't get – one where he felt consistently safe and valued. He mourns the friendships that ended hurtfully and the loss of innocence that came with those betrayals. By grieving, he honors the significance of those losses rather than minimizing them. It's emotionally heavy work, but it clears space for new growth – like clearing a wound of debris so it can finally close properly.

Encouragingly, the progress is evident. Those close to Michael have noticed that in the last couple of years, he carries himself with a bit more confidence and a softer self-regard. He's more open about discussing his past and its effects, which in turn invites deeper support from friends and family who then know what he's dealing with. This openness is itself a triumph over trauma (which often silences people in shame). Additionally, Michael has started to **forgive** – both others and himself. He's working on forgiving his parents for their shortcomings (recognizing they had their own struggles), forgiving the bullies (recognizing they were kids with issues of their own), and crucially, forgiving *himself* for the coping mechanisms he developed (like avoiding or lashing out). He understands now that those behaviors were his mind's way of surviving at the time. This forgiveness doesn't excuse what happened, but it releases some of the bitterness and self-blame that kept him stuck.

In conclusion, Michael's past is marked by significant emotional wounds, but he is actively and bravely engaging in the **process of healing**. Through self-reflection, supportive relationships, therapy, and creative expression, he is tending to his inner child and rewriting the narratives that trauma wrote for him. He is learning that the events that hurt him are *part* of him but do not have to define *all* of him. With each layer of trauma he processes, another piece of his authentic self – one not ruled by fear or pain – emerges. This trauma-informed healing is a critical underpinning to all the other aspects of his profile: as he heals, his emotional regulation improves, his attachment style inches toward security, his core beliefs shift positively, and his true creative voice grows louder. It's the hard work behind the scenes that is enabling Michael to move from merely surviving to truly thriving.

## **Passion for Self-Help, Narrative Frameworks, and Meaning-Making**

Michael has an evident **passion for self-improvement and understanding life's narratives**. He's something of a self-professed personal development enthusiast – not in a superficial “life hack” way, but in a quest for genuine understanding and growth. He voraciously reads and absorbs frameworks that offer explanations for behavior and strategies for change. This passion is both an intellectual hobby and a coping mechanism: by learning *why* he or others

act as they do and *how* one can improve habits or mindset, Michael gains a sense of agency and hope that he can continuously better himself and his life.

One of his favorite frameworks is from the bestseller *“Atomic Habits”* by James Clear. Michael was very inspired by Clear’s idea that **small, consistent habits compound over time to produce big results** – the famous notion that a 1% improvement each day can lead to being 37 times better after a year [thegrowthfaculty.com](http://thegrowthfaculty.com). This resonated strongly with Michael’s experience: he’s seen how tiny changes (like writing a little each day or doing a brief daily meditation) can add up to noticeable progress, whereas aiming for drastic overnight change often fails. He appreciates the focus on *process over outcome* in Atomic Habits. Embracing this, he’s tried to implement habit-building techniques in his own life, especially to help manage his ADHD challenges. For example, instead of vowing to completely organize his life (an overwhelming goal), he might start with the tiny habit of writing down one priority for the next day each night before bed – a small action, but one that, if repeated, could improve his planning skills over time. Atomic Habits gave him a language and method to tackle his routine struggles in bite-sized pieces, which is far more ADHD-friendly. It also taught him that **environment design** is key – so he has, for instance, started placing his guitar on a stand in the middle of his room to encourage daily practice (making the desired habit obvious), and conversely, he might tuck away distractions (like leaving his phone in another room while working) to make bad habits harder. These practical tips from the book have empowered him to scaffold his day in a way that aligns with his goals, even when motivation is low.

Another influence is author **John Green**, whose works (both fiction and non-fiction) often delve into meaning, human connection, and emotional truth. Michael admires how Green finds profound insight in seemingly mundane or quirky topics (like in *The Anthropocene Reviewed*, Green reviews facets of life from Dr. Pepper to sunsets, extracting deeper reflections). This has encouraged Michael’s own practice of reflective cataloging – seeing his life experiences as stories or “reviews” he can analyze for meaning. For example, after going through a tough time, Michael might write a reflective piece in Green’s style, rating the experience not in a trivializing way but to articulate what he learned from it. John Green’s blend of earnestness, vulnerability, and humor in interpreting life’s events validates Michael’s emotional way of

processing the world. It also reassures him that even difficult experiences can later yield understanding or even beauty when framed in a narrative. Green's work often touches on mental health, love, and finding hope amidst hardship – themes that speak directly to Michael's journey. Reading such narratives has given Michael both comfort (feeling seen in those pages) and tools (metaphors or analogies to make sense of his own feelings).

Michael is also drawn to the big-picture analytical storytelling of **Malcolm Gladwell**. Books like *"Outliers"*, *"The Tipping Point"*, or Gladwell's podcast episodes intrigue Michael because they reveal hidden patterns in human behavior and society through engaging stories. This aligns with Michael's desire to *understand underlying reasons* for why things happen. Gladwell's work often says "X seemingly small factor actually hugely influences Y outcome" – and this kind of insight appeals to Michael's analytical side and his hope that maybe by tweaking certain factors in life, one can change outcomes. For instance, Gladwell's discussion of how cultural legacies or 10,000 hours of practice contribute to success might make Michael reflect on his own life advantages or the hours he's dedicated to his crafts, reframing how he sees his trajectory (perhaps easing some of the self-blame by acknowledging systemic factors, or motivating him to continue deliberate practice in areas he wants to excel). Moreover, Gladwell's narrative style – weaving research with anecdotes – influences how Michael approaches his own reflective writing or even how he communicates in teaching; he likes to combine data or theory with story, much as Gladwell does.

Beyond those specific authors, Michael engages with a lot of **self-help content**: productivity blogs, psychology podcasts, TED talks, etc. He tends to pick and choose what resonates rather than follow any one guru religiously. His BS radar is fairly good; he's looking for *evidence-based* or at least well-articulated concepts that he can test in his life. For example, he read about the concept of growth mindset (Carol Dweck) and actively tries to remind himself that abilities can be developed, not fixed – which helps counter his perfectionism. He explored the Enneagram and Myers-Briggs not as rigid labels, but as lenses to better understand his motivations and tendencies (finding that, say, as an INFJ or a Type 4, it's natural for him to be introspective and idealistic, which gave some self-acceptance). He also enjoyed works by

Brené Brown on vulnerability, which bolstered his resolve to be more open about his feelings despite fear.

An interesting habit of Michael's is **cataloging what he learns**. He keeps notes or spreadsheets of insights from books and talks. He might jot down quotes that moved him, or keep a list of cognitive biases he learned about, etc. This practice of externalizing knowledge serves two purposes: it helps him remember and synthesize the information (as his ADHD can make retention tricky unless he actively engages with the material), and it gives him a sense of progress – a tangible record of how his understanding has expanded over time. It's motivating for him to see, for instance, a notebook filled over the year with summaries of each self-help book he read, as it symbolizes growth.

Michael's drive to "find language for experience" is a notable thread. Many times in his reflections, he's found immense relief when he discovered that a concept or term exists for something he felt. A clear example is when he learned about *Rejection Sensitive Dysphoria* – putting a name to his extreme reaction to rejection was almost revelatory; it wasn't just "something wrong with me," it was a known phenomenon many others have. Similarly, learning about childhood emotional neglect or ADHD executive function deficits, etc., all gave him vocabulary to articulate his struggles. As a result, he's passionate about **narrative and psycho-educational frameworks** because they give shape to nebulous experiences. He almost acts as a self-anthropologist, collecting these terms and theories to build a personal framework of understanding himself. It's empowering – language and knowledge turn confusion into clarity, and pain into something that can be worked with.

In practice, this means when Michael encounters a problem, he often researches it. If he and his partner have communication issues, he might dive into attachment theory (which he did) and share insights with his partner about their patterns, essentially using the framework to navigate their relationship. If he's feeling stuck in life, he might recall the concept of "ikigai" (a Japanese concept for meaning) or others he's come across, to reassess where he finds purpose. One might think all this analysis could be overkill, but for Michael, it's actually soothing. It's his way of exerting cognitive control over the chaos of life – by understanding it, naming it, and thus feeling less at its mercy.

Michael also finds **community and connection** through these interests. He enjoys discussing self-help ideas with friends who are similarly inclined or on forums. These discussions themselves create a sense of connection (“we’re all working on ourselves, figuring life out together”) which he finds meaningful. It’s not just navel-gazing; for him, it’s sharing life’s playbook and supporting each other’s growth. He has even led a small book club with a few friends where they read a personal development book and meet to talk about how to apply it in their lives. In those moments, he’s almost in a mentoring role, guiding others through frameworks he’s passionate about – which also reinforces his own learning.

One caution is that Michael can sometimes overload on information and feel overwhelmed by *too many* frameworks or advice, especially if they conflict. He has recognized analysis paralysis can extend to self-improvement too (e.g., “Should I prioritize habit tracking or emotional mindfulness or this or that?”). When he notices this, he reminds himself there’s no one right way and that he doesn’t have to implement everything at once. He’s learning to trust his intuition on which concepts resonate most or are worth trying, and which to let go.

Overall, Michael’s love of self-help and narrative frameworks is a positive driving force. It keeps him oriented toward **hope and progress** – there’s always something new to learn, a new way to improve, a fresh perspective to gain. This growth mindset shields him against the despair that can come from feeling stuck or doomed by one’s past. It also fuels his sense of purpose: he often envisions eventually synthesizing all he’s learned into something that could help others, perhaps writing his own book or creating content to share his journey and tools. In that way, his personal passion could come full circle into a creative contribution (which ties back into his core value of creating meaning for others).

In summary, Michael actively engages with self-help literature and narrative psychology both as a means of **self-discovery** and as a compass guiding him toward who he wants to become. It reflects an optimistic belief that **change is possible** and that life can be understood and improved through knowledge and reflection. This evolving personal philosophy – combining small habit changes, vulnerability, understanding patterns, and constant reflection – is becoming an integral part of Michael’s identity. It’s the framework within which he’s integrating all other aspects of his profile: making sense of his ADHD in light of

neuroscience, his emotions in light of psychology, his trauma in light of narrative healing, and his relationships in light of attachment theory. All of this learning is helping him construct a cohesive story of who he is, where he came from, and where he's going – a story that, for the first time, he feels is authored by *him* and not just by the wounds of his past.

## Integration and Evolving Self-Awareness

Through weaving together his neurodivergent traits, emotional patterns, attachment style, core beliefs, perfectionism, creativity, coping tools, trauma history, and love for self-improvement, Michael Slusher is actively crafting a more integrated and self-aware identity. This comprehensive understanding of himself – as detailed in the sections above – is itself a significant achievement of his personal growth. By seeing how each piece connects (for instance, how trauma feeds negative beliefs, or how ADHD influences his need for structure in creativity), Michael is better equipped to address challenges in a holistic way rather than feeling overwhelmed by isolated issues.

One major theme in his evolving self-awareness is **self-compassion and acceptance**. As he learns about the origins of his struggles, he views himself with more empathy. He now can say, “I react this way because of X in my past” not as an excuse, but as a compassionate explanation that opens the door to healing. This shift from self-blame to understanding has been pivotal. It allows him to experience tough emotions or setbacks without labeling himself a “bad person” or “hopeless.” Instead, he thinks, “This is an area I’m working on, and I know why it’s hard, and that’s okay.” Such gentle inner dialogue was nearly absent a few years ago but is increasingly present now.

Another sign of integration is how he’s leveraging his **strengths to support his weaknesses**. For example, his creativity and love of narrative (a strength) is being used to cope with and make sense of his trauma and emotions (a weakness area). His analytical mindset is helping him structure solutions for his ADHD issues. His empathy for others is slowly being turned inward to nurture himself. Rather than seeing his traits in siloed “good” or “bad” categories, he’s blending them. Even his sensitivity, which he once maybe wished away, he now recognizes as the same source that gives him artistic insight and deep

connections; so while he's learning to manage its downsides, he's also cherishing its gifts.

Michael's identity reconciliation is also about integrating the **past Michael with the present Michael**. He's actively bridging who he was (the hurt child, the awkward teen, the driven but insecure young adult) with who he is becoming (a more confident, healed individual). Instead of trying to forget the past or be someone completely new, he's carrying those past selves with him, honouring them as part of his story. This gives him a sense of continuity and wholeness. For instance, he might visit his childhood creative projects – old drawings or videos – and feel pride and affection for that kid, realizing that pure creative spark was always there and still is. By doing so, he knits together his narrative: the creative little boy, the struggling adolescent, and the reflective adult are all chapters of one book.

His values are clarifying as well. Through all the introspection and experience, Michael has pretty clearly identified what matters most to him: **authenticity, creativity, compassion, connection, and growth**. These core values guide decisions he makes now. When he faces a choice – be it a career move, a relationship, or how to spend his time – he measures it against those values. Does it allow him to be authentic? Is there room for creativity? Does it align with compassion (for himself and others)? Will it foster meaningful connection? Does it facilitate growth? Having this values compass is a sign of a more consolidated identity; he knows what he stands for, which helps him navigate life with more confidence.

Michael's journey is ongoing – there will always be new layers to uncover and growth to be had – but he has reached a point where he can genuinely acknowledge how far he's come. If he compares his current self to, say, five years ago: back then he felt much more at the mercy of moods, criticism, and chaos, often not understanding why he felt what he felt. Now, he has a framework for understanding himself, he anticipates his triggers and needs, and he's developed strategies to handle them. This doesn't mean he never struggles – he certainly still does – but when he does, he bounces back faster and treats himself more kindly in the process. That resilience is a direct outcome of the work he's done to integrate all aspects of his psyche.

Crucially, Michael's story is one of **hope and empowerment**. Each aspect that once caused him pain has become an area of knowledge and strength. His ADHD, once a source of shame, is now something he advocates for – he's open about being neurodivergent and even helps others understand it, thereby turning it into a point of pride in diversity. His emotional sensitivity, once overwhelming, is now something he navigates with tools and even leverages in his art. His fear of failure, once paralyzing, is now more of a manageable discomfort as he trains himself in the mindset that mistakes are part of the process (and he's begun to collect evidence of that from his own successes after initial failures). His attachment fears, once causing sabotage in relationships, are now gradually easing as he communicates more and chooses safe people to surround himself with, creating healthier relationship dynamics.

What emerges is a **portrait of a young man who is remarkably introspective, resilient, and earnest in his pursuit of a fulfilling life**. Michael's profile is not defined solely by his difficulties, nor solely by his talents, but by the interplay of both – and how he has learned to dance between them. He embodies a combination of artist's soul, thinker's mind, and survivor's grit. This updated comprehensive profile shows Michael Slusher as he is: a person who **feels deeply, cares deeply, and tries daily to align his life with his ideals**, all while carrying the weight of his past and the light of his hopes into the future.

Moving forward, Michael will continue this journey of growth. Armed with self-knowledge and supportive relationships, he is better prepared than ever to face new challenges. He aspires to channel his self-awareness into creative and possibly scholarly outputs – perhaps creating content that helps others the way he helped himself, completing projects that encapsulate his hard-won insights, or maybe mentoring youth who struggle like he did. In doing so, he finds a sense of **purpose**: transforming personal pain into collective healing. This purpose-driven outlook is the final piece of integration – it's where his individual story meets the larger world. Michael increasingly sees that his experiences, for all their hardships, allow him to contribute uniquely to others. In that recognition, he finds redemption and meaning.

In conclusion, Michael Slusher's psychological profile is one of **complexity and coherence** coming together. He is a neurodivergent, sensitive soul shaped by trauma but not defined by it, fueled by creativity and an analytical quest to improve, hindered at times by perfectionism and fear but never ultimately

stopped by them. His toolbox is full – of strategies, knowledge, and passion – and he is learning to use each tool at the right time. The evolving self-awareness evident in this profile is itself a testament to Michael's character: courageous, inquisitive, and hopeful. He has learned to map his inner landscape with honesty and care, and with that map in hand, he is navigating towards a life of authenticity, connection, and continual growth. Each day, he reconciles a bit more of who he was with who he is becoming, writing the next chapter of his story with intention and heart. And perhaps the most important development of all – Michael is beginning to truly like the person he is discovering himself to be, which may be the strongest indicator that his journey of healing and self-integration is on a profoundly positive trajectory.
